| $\$ 143,105,000$ | $\$ 145,105,000$ | $\$ 143,105,000$ | $\$ 160,037,000$ |

## CDC's Heart Disease and Stroke Prevention Program

CDC works with state health agencies and other partners to prevent, detect, and treat risk factors for heart disease and stroke. CDC supports state-based heart disease and stroke prevention activities, the Paul Coverdell Acute Stroke Registry Program, Sodium Reduction in Communities Program, and the WISEWOMAN program.

Funding this program at $\$ 160,037,000$ will allow CDC to continue to provide critical resources for states to focus on this common and often preventable cause of death and disability.

## Basic Facts about Heart Disease and Stroke

- Heart disease and stroke are the first and fifth leading causes of death in the United States.
- More than 655,000 people die in the United States each year from heart disease-that is one in every four deaths or one death every 36 seconds. Approximately every 40 seconds, an American will have a coronary event, and approximately every minute, someone will die of one.
- Each year, an estimated 795,000 people experience a stroke. On average, one American dies from stroke every four minutes.

## Cost of Heart Disease and Stroke to the American Health Care System

- About one in every seven healthcare dollars, or $15 \%$, is spent on cardiovascular disease.
- The total direct and indirect cost of cardiovascular disease and stroke in the United States for 2014-2015 was estimated to be about $\$ 351.2$ billion. The total annual costs associated with high blood pressure were estimated to be nearly $\$ 56$ billion in 2014-2015.

## Heart Disease and Stroke are Preventable and Controllable

- About half of U.S. adults have at least one of the following major risk factors for cardiovascular disease: uncontrolled high blood pressure, uncontrolled high LDL (bad) cholesterol, or are current smokers.
- Nearly half of adults, or 108 million, have high blood pressure (hypertension) and only one in four adults have their condition under control.
- Reducing average population sodium intake to $2,300 \mathrm{mg}$ per day could save 280,000 to 500,000 lives and $\$ 100$ billion healthcare dollars through 2030.
- A $10 \%$ decrease in total cholesterol levels in the U.S. population overall may result in an estimated $30 \%$ reduction in the incidence of coronary heart disease.
- Cigarette smokers are two to four times more likely to develop heart disease and two to four times more likely to have a stroke as nonsmokers.
